Safety through quality

SPLIT-BALL PROBES

Split-ball probes are universal bore gauges for indicating internal measurements. The modular design with extensive accessories enables gauging of most common bores. This allows use for serial and individual control as well as preferentially in the plant directly at the production machine.

Due to different styles through bores, blind bores, parallel distances, etc. can be gauged.

Technical data

Operating range:

- Standard split-ball probe in hard chrome:
Ø 0.47 – 41.1 mm
- Standard split-ball probe with carbide contacts:
Ø 1.5 – 41.1 mm (for heavy wear conditions)
- Standard split-ball probe with ceramic contacts:
Ø 3.7 – 41.1 mm (for soft materials like aluminium etc.)
- Blind bore split-ball probe:
Ø 1.5 – 41.1 mm (for gauging close to bottom of bore)
- 3-point split-ball probe :
Ø 4.75 – 150,6 mm (gauging of polygon-shaped workpieces)
- T-probes: Ø 2.05 – 9.8 mm (for gauging deep bores with Ø smaller than 8.2 mm)

Measuring range:

0.06 mm up to 2.2 mm (according to size of probe)

Accuracies:

Repeatability (standard split-ball probes):

Manual gauging c. 1 µm,
Stationary gauging in stand < 0,5 µm

Linearity (standard split-ball probes):

Size 0.5 – 1.50 max. 2% of travel, min. 0.001 mm
Size 1.75 – 40 max. 1% of travel, min. 0.001 mm

Calibration with setting ring

Measuring depth:

Up to Ø 4.2 max. 750 mm (T-probes with TV2/TV2,5)
Ø > 4.2 – 8.3 max. 1000 mm (T-probes with TV4)
Ø > 8.3 – 41.1 several metres (standard split-ball probes with TV8)

Contact points:

Standard version in hard chrome, different materials like carbide, ceramic (depending on size).
Special shapes for blind bores, parallel distances (grooves)
Special shapes on request

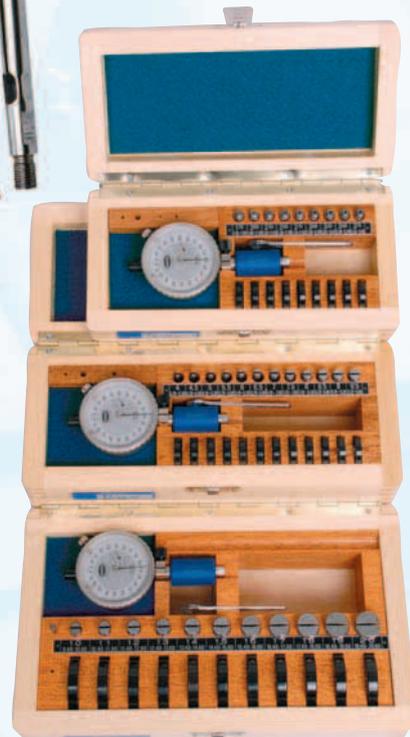

Ø kleiner 8,2 mm)

T-PA

T-3P

Sicherheit durch Qualität
Safety through quality

Design

A split-ball probe unit consists of at least 5 parts:

Probe (4) made of hardened steel – in standard version chromed c. 1000 HV

Tapered needle (3) made of hardened steel or carbide with lapped taper.

Hardness steel needle: 62-64 HRC, hardness carbide needle: c. 1600 HV

Indicator holder (2) MH6-51 with clamp 8H6 or MH6-51-Z with clamp 3/8", retracting indicator holder MH6-73-R

Indicating unit (1) any mechanical or electronic indicator, micro comparator or electronic probe with display

Setting ring: DIATEST setting rings are available in metric or inch sizes. Rings up to $\varnothing 1.5$ have an insert made of synthetic sapphire, all other sizes are made of artificially aged and wear resistant special steel. DIATEST setting rings can only be supplied in fixed sizes according to works standard. Intermediate sizes can only be supplied as DIN 2250-C setting rings.

Travel transmission

The lapped taper of the needle transfers the spreading movement of the split-ball probe in a 1:1 ratio to the indicator.

Working Principle

The semicircular anvils of the probe are spread by the measu-

ring pressure of the indicating unit and centre themselves in the bore. The gauge is zero-set (calibrated) in a setting ring. When gauging by hand, determine axial centering by rocking gauge assembly in bore (see below ill., middle). Reversal point of Indicator hand shows measured value. When checking stands are used, rocking movement is not required.

Range of operation

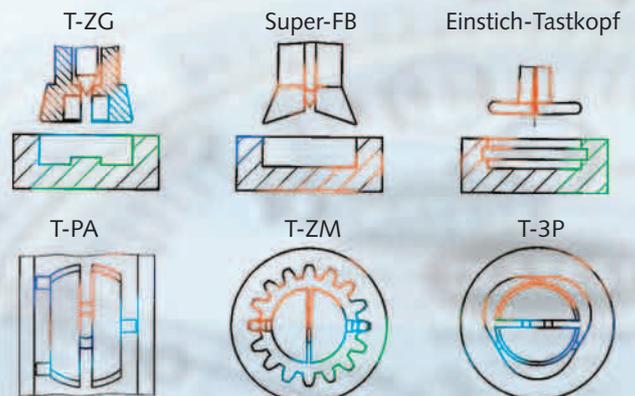

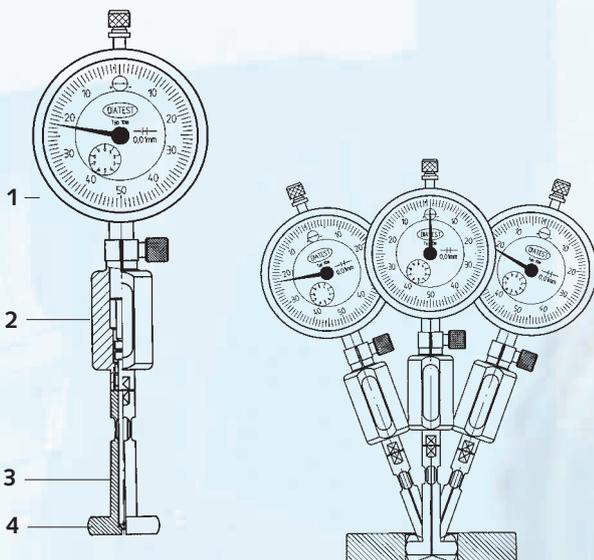

Apart from bore diameters DIATEST split-ball probes can detect geometrical shape defects such as ovality, concentricity, barrel-shape, etc. Besides, split-ball probes are available for gauging parallel distances, groove toothing (serration), internal gears and recesses.

Special shapes on request

Send drawing, workpiece sample and description of gauging method with inquiry.

Some special shapes of DIATEST split-ball bore gauges:

- T-ZG: bore gauging with centre stud (on request)
- Super-FB: blind bore gauging up to c. 0.1 mm to bore ground (on request)
- Recess-probe: diameter gauging of recesses (on request)
- T-PA: gauging of parallel distances (see page 6)
- T-ZM: gear gauging from $M_i = 3.5$ mm (see leaflet "Internal Gear Gauges")
- T-3P: gauging of polygon shapes from $\varnothing 4.75$ mm (see page 6)

Accessories

A large assortment of accessories complete the split-ball-programme. The standard connection thread M6 x 0.75 enables a multiple combination of the individual gauging elements according to the measuring job.

Retracting indicator holder (MH6-73-R)

For easy entry in bore.

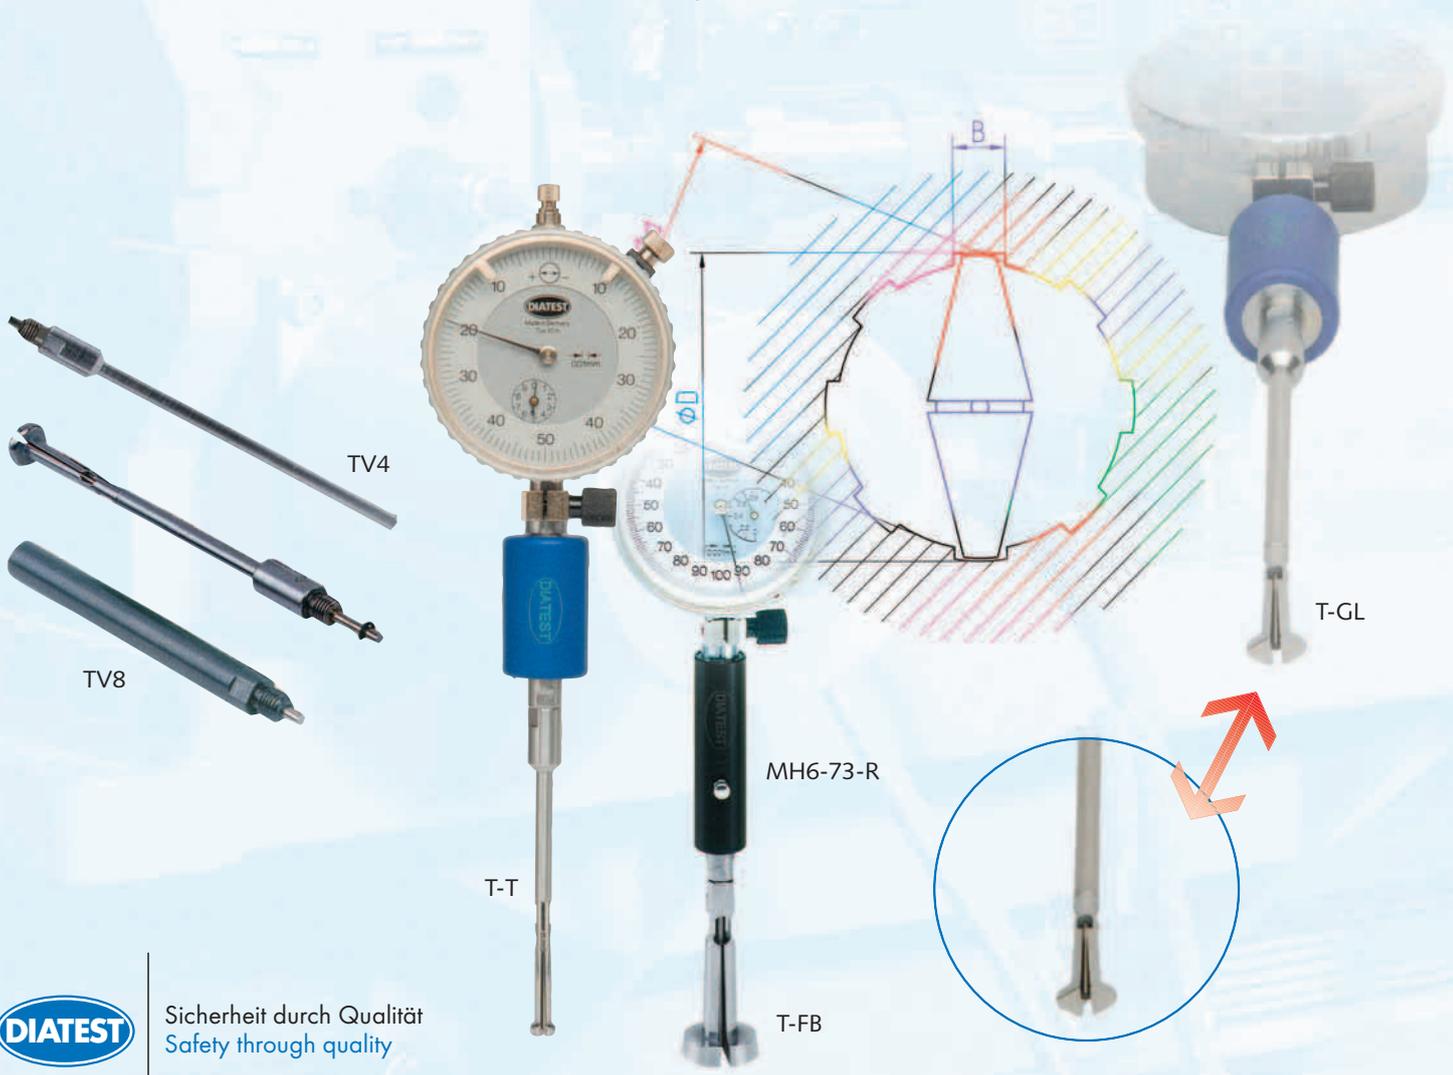

Depth extension TV8 (Ø 8,0)

For measuring deeper bores from c. Ø 8.2 mm. Available in different lengths from L = 20 mm up to L = 1000 mm. From TV8-80 (L = 80) depth extensions are temperature-stabilized.

Depth extensions for T-probes ...

... are required in combination with T-probes for measuring deeper bores smaller than Ø 8.3 mm. Diameter of extension depends on design of T-probe: TV2 (Ø 2.0), TV2.5 (Ø 2.5), TV4 (Ø 4.0). Extensions are available in different lengths from L = 20 mm up to L = 1000 mm (depending on extension). Connection thread of one side is always M6 x 0.75. This allows connection of all accessories. T-extensions are temperature-stabilized.

(T-GL: To measure the groove-Ø of twisted grooved tubes, like e.g. gun barrels. Measuring range of probes: Corresponding to T- or standard probes – see tables on page 12-14 and 20-21).

Sicherheit durch Qualität
Safety through quality

Right angle attachment (W6)

Screwed between holder and probe where clearance between tool and workpiece is limited. Minimum distance between right angle attachment and obstacle: 27 mm plus length of probe (see table page 14).

Depth stops (TA8...)

Ideal for gauging bores at a specific depth. Also search for reversal point can be omitted. The depth stop TA8-24 is clamped onto depth extension TV8. The stop ring $\varnothing 24$ is interchangeable with stop rings $\varnothing 45$ or $\varnothing 60$. It is also possible to screw on a special stop ring instead of the discs.

Rotary adapter (TV64-D)

Probe can be turned in bore while dial indicator remains stationary. Specially suitable for roundness measuring of workpieces which cannot be turned.

Checking stands

In combination with split-ball probes checking stands offer a safe basis for an exact and fast bore gauging (measuring of \varnothing , bell mouth, conical form, barrel shape, roundness etc.). Search for reversal point is omitted. Amount of stroke can be set precisely.

This is particularly important when shape defects are detected. Accessories like e.g. floating holder and vee attachment enable a reliable and fast transaction of gauging also for unskilled workers. By using adjustable depth stops one can carry through measurements in indicated depths. Specially beneficial is the use of stands directly on the working place for bore control during production.

MST58

MST102

Sicherheit durch Qualität
Safety through quality

Floating holder (SH-T)

It allows the split-ball probe, which is clamped in the checking stand, a slight "floating" in horizontal plane. A probe easily finds the exact axis when entering into the bore. Floating range continuously adjustable from 0 to 1.5 mm (until 3 mm without regulation).

Version SH-T-F for adjustment of measuring pressure.

Universal checking stand (MST102)

This checking stand is suitable for larger sizes. The measuring stroke is continuously adjustable from 0 – 130 mm. The vee attachment (standard accessory) or other centering devices can be mounted on the platen (100 x 100) in a T-slot.

Extras:

- Collar for $\varnothing 30$ mm c/w dial gauge bracket for precise height adjustment
- Platens in different widths (130 mm and 160 mm)
- Jib arms (150 mm and 200 mm) for larger work-pieces and BMD-floating holders (SH-BMD30)

Checking stand (MST58)

The MST58 is easy to handle and especially suitable for small work-pieces. The measuring stroke is continuously adjustable from 0 – 35 mm. With the checking nut you can easily and exactly adjust the height. The diameter of platen is 58 mm.

Extras:

- For easy positioning a clamp-on-vee (MST-WA) can be fixed to platen
- Perforated platen (MST-MT80) for measuring through bores up to $\varnothing 13$ mm

Technical information

Maximum measuring depth M

Depends on probe size. For determination of max. measuring depth. Insert bore gauge partly into bore up to indicator.

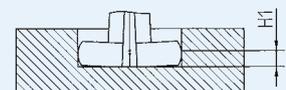

Larger measuring depths from:
 \varnothing 8.20 mm with extension
 \varnothing 2.05 mm with T-probes
 \varnothing 0.95 mm with special probes

Length of probes L

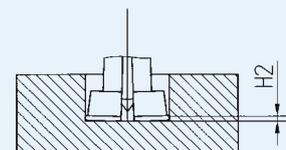

When space is limited and right angle attachment is used, minimum distance between bore obstruction = 27 mm + length of probes (L).

Minimum measuring height H

Indicates how close to bore ground can be gauged when probe is spread to maximum.

Standard probe

Blind bore probe

DIATEST small bore gauges, standard, carbide and blind bore for bore hole Ø 0.0185" to 1.6200".

Technische Informationen Technical information

Maximum measuring depth M

Depends on probe size. For determination of max. measuring depth. Insert bore gauge partly into bore up to indicator.

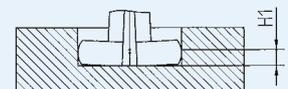

Larger measuring depths from:
Ø 8.20 mm with extension
Ø 2.05 mm with T-probes
Ø 0.95 mm with special probes

Length of probes L

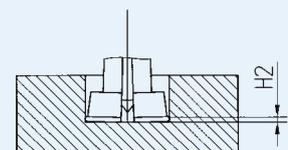

When space is limited and right angle attachment is used, minimum distance between bore obstruction = 27 mm + length of probes (L).

Minimum measuring height H

Indicates how close to bore ground can be gauged when probe is spread to maximum.

Standard-Tastkopf
Standard probe

Sackloch-Tastkopf
Blind bore probe

**DIATEST-T-probes to measure deeper bores,
Ø 2.05 mm to 9.80 mm.**

¹⁾ 3-point probes are carbide inserted, angular position 120°.
3-point probes with different angular position and
3-point blind bore probes (hard chromed) on request.

DIATEST-PA-probes to measure parallel distances from 4.7 mm to 41.1mm/0.185" to 1.618".
