

# CMM Calibration Artifact

Our CMM Calibration Artifact is designed for use as an Intermediate Check with Coordinate Measuring Machines (CMMs) and includes an ISO-17025 Accredited Certification.

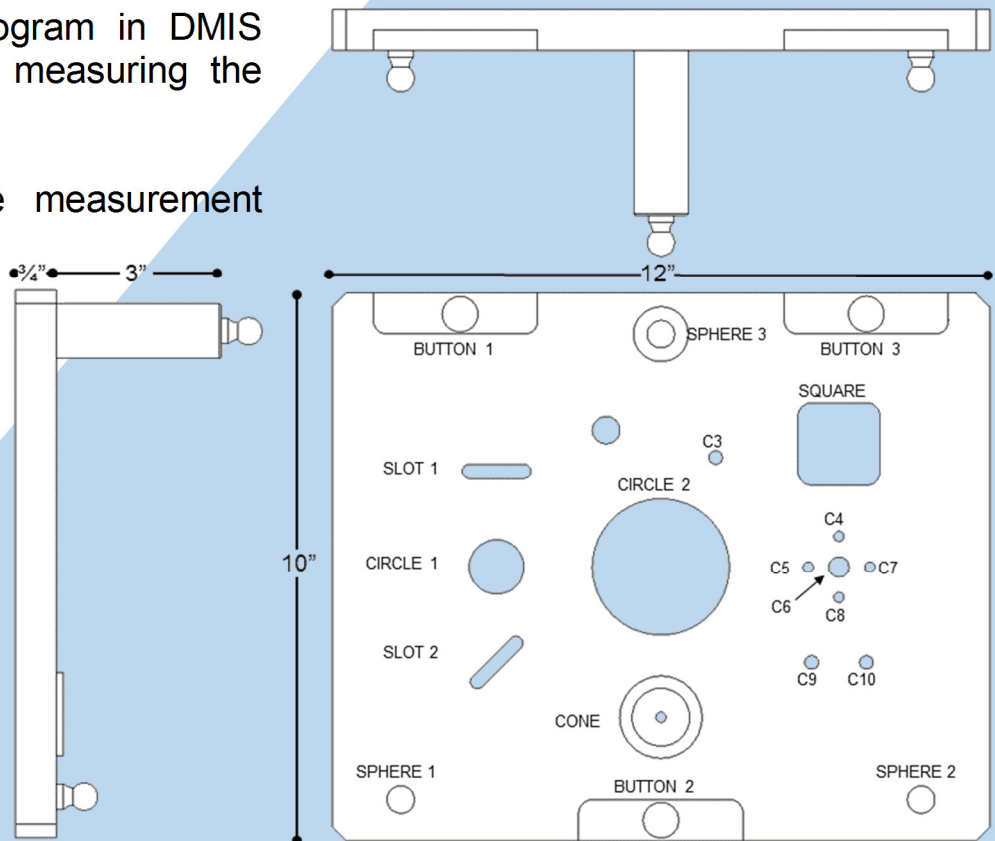

It is designed to provide added confidence in a CMM between annual calibrations. By performing an artifact calibration routine on a regular schedule, the accuracy of your CMM is monitored and allows you to be proactive if any "drift" is discovered.

A variety of geometry types are included: circles, slots, widths, spheres, cone, etc...

Optionally, a CMM program in DMIS format is available for measuring the artifact.

This ensures that the measurement routine is the same as the one used to certify the artifact.
