

Better linearization – Higher measurement certainty!

The newly developed DIATEST BMD **XQ** reduce the linearity deviation by up to 50% compared to conventional standard plug gauges from all over the world.

DIATEST BMD **XQ** – Higher measurement certainty

Thanks to the highly increased measurement certainty we can calmly face the tendency of continuously closer tolerances. Particularly in combination with the digital indicator DIATRON1000 with its resolution of 0.1 μm one can be sure that the measured values are absolutely correct. The complete measuring system can be linearized according to e.g. VDA volume 5 (German Association of the Automotive Industry).

All measured data can optionally be backed up and further processed by radio transmission. As a result the valuable data are available for the further production process.
